VC v0.35 — Amendment 10

AdjacencyReview2026 cycle: three adjacency papers triaged; body access on Paper 3 (Samaddar-Singh 2025); deeppass + addendum with peer-review-status verification

Document version: VC v0.35 Amendment 10 (markdown) **Date:** 27 May 2026 (AEST) **Working language:** Australian English (per standing rule v0.35) **Page format target:** A4 when converted to DOCX/PDF (per standing rule v0.35) **Author of trial:** Stephen L Browne **Drafter:** Claude Opus 4.7 Adaptive (Anthropic) **Trial:** UMF Trial S3M0S1

---

§1 Amendment scope + production reason

Amendment 10 captures the AdjacencyReview2026 cycle: corpus-currency due-diligence review of the three adjacency papers held aside per Amendment 9 §3.I, performed under the §7.5 standing rule formalised in Amendment 9 Addendum (periodic corpus-currency verification on Stephen-supplied review lists is routine research-hygiene activity; does not require fresh scope-expansion authorisation; web-search access implicitly authorised for verification on Stephen-flagged papers).

The amendment provides the audit-trail anchor for:

- Step 1 provenance verification of the three adjacency papers (arXiv:2506.18949 Malakar; arXiv:2605.14377 Malakar-Mazumdar-Bhuyan; arXiv:2512.06009 Samaddar-Singh)
- Step 2 relevance assessment confirming F-05 modified-gravity-extensions sub-list placement for all three
- Step 3 per-paper decisions: Papers 1 + 2 abstract-verify only (mirrors original-cycle Papers 1, 3, 4, 6, 7, 9 treatment); Paper 3 body-access deep-pass per Stephen direction 27 May AEST
- Paper 3 (Samaddar-Singh 2025) deeppass-report production with substantive honest-disclosure observations §7.1–§7.10

- Paper 3 deeppass addendum capturing peer-review-status verification finding (preprint-only as of 27 May AEST; no journal publication after ~5 months) and connection to anchor-deeppass §7 quality concerns
- One labelling clarification on Amendment 9 §3.I "Nojiri-Odintsov f(R) baryogenesis" shorthand (model class, not authorship; actual Paper 1 first author is Malakar)

Production reason (Stephen verbatim direction 27 May AEST): "There are 3 papers listed pending for review for provenance and relevance as a next step."

Stephen verbatim direction on framing (27 May AEST): "Part of the research is empirical findings (positive or negative are welcome)."

Stephen verbatim direction on peer-review-status finding (27 May AEST): "Suspect data is reason to note this paper as such."

Audit-trail anchor status: Amendment 10 supersedes Amendment 9 (and its Addendum) as the current audit-trail anchor for trial state. Amendment 9 + Amendment 9 Addendum retain their prior-anchor status for the post-January-2026 reading layer + methodology corrective + framing correction they capture.

---

§2 Source documents added in this cycle

The AdjacencyReview2026 cycle produces deliverables as follows:

Produced in this thread: 1. **VC v0.35 Amendment 10** (this document; markdown) — audit-trail anchor 2. **F-05*Paper3*Samaddar2025*AdjacencyReview2026*deeppass.md** (markdown) — proof-of-research-provenance artefact for body-access content on Paper 3 3. **F-05*Paper3*Samaddar2025*AdjacencyReview2026*deeppass_Addendum.md** (markdown) — peer-review-status verification + strengthened quality-concerns characterisation

Pending for next-thread cycle delivery (per Stephen sequencing direction 27 May AEST, option (ii)): 4. UMF Trial S3M0S1 Synthesis Paper Scaffold v8 consolidated (markdown) — corpus update; §5.2 + §11.3 + §13.2 §5 substantively extended with AdjacencyReview2026 cluster content 5. UMF Trial S3M0S1 Research Plan v0.6 Draft (DOCX) — substantive corpus update 6. UMF Trial S3M0S1 Thread Handoff v6 (markdown) — thread-state recovery

Predecessor deliverables retained unchanged per audit-trail integrity rule: - VC v0.35 Amendment 9 — prior anchor, content unchanged - VC v0.35 Amendment 9 Addendum — prior anchor, content unchanged - VC v0.35 Amendment 8 — prior anchor, content unchanged - VC v0.35 Amendment 7 — prior anchor, content unchanged - UMF Research Programme Introduction Letter v2 — mandatory bundle, continues unchanged - Synthesis Paper Scaffold v7 consolidated — to be superseded by v8 in next-thread cycle delivery, retained unchanged - Research Plan v0.5 Draft — to be superseded by v0.6, retained unchanged - Thread Handoff v5 + Addenda 1 + 2 — to be superseded by Handoff v6, retained unchanged - Three Amendment 9 cycle deeppass reports (Pereira, Whittingham, Liu-Qin-Bian) — proof-of-provenance artefacts, unchanged

Trial Introduction Letter v2 continues to be mandatory bundle per Amendment 8 §K for any future thread initialisation, alongside Handoff v6 (when produced), Amendment 9, Amendment 9 Addendum, and Amendment 10.

---

§3 Material changes captured in Amendment 10

§3.A AdjacencyReview2026 cycle scope

Per the §7.5 standing rule (Amendment 9 Addendum), this cycle is corpus-currency due-diligence on the three adjacency papers held aside per Amendment 9 §3.I. The standing rule operates routinely; no fresh scope-expansion authorisation requested or required. The cycle deliberately does not introduce new framework territory, new postulates, or new ESCALATE matrix entries. Sub-list updates and reference-list extensions only.

The cycle implements the Step 1 → Step 2 → Step 3 → Step 4 sequence proposed and authorised this thread: - Step 1 (provenance verification) — performed; results §3.C - Step 2 (relevance assessment) — performed; results §3.C + §3.E - Step 3 (per-paper decisions) — Stephen direction 27 May AEST: Papers 1 + 2 abstract-verify; Paper 3 body-access deep-pass - Step 4 (cycle delivery) — Amendment 10 (this thread); Scaffold v8 + Research Plan v0.6 + Handoff v6 (next thread per Stephen sequencing direction option (ii) 27 May AEST)

§3.B Web search authorisation

Web search access used in this cycle for: (i) arXiv listing verification of three adjacency papers; (ii) Samaddar-Singh peer-review-status verification (Paper 3 journal-publication record search). Both uses fall within the §7.5 standing rule scope (corpus-currency verification on Stephen-flagged papers). No new framework commitments introduced; no new ESCALATE matrix entries created.

§3.C Three adjacency papers triaged

The three adjacency papers from Amendment 9 §3.I are processed this cycle. Triage outcomes:

arXiv ID	Title / model class	Authors (verified)	Submission	Sub-list	Treatment
2506.18949	"Gravitational Baryogenesis Constraints on Nojiri-Odintsov f(R) Gravity"	Kalyan Malakar + 1 other	23 June 2025	F-05 (curvature-based modified-gravity-extensions)	Abstract-verify only
2605.14377	"Cosmological Realization of Baryon Asymmetry in f(R, G_μv T^μv) Gravity"	Kalyan Malakar, Rajdeep Mazumdar, Kalyan Bhuyan	14 May 2026	F-05 (curvature-based modified-gravity-extensions; EMSG-adjacent)	Abstract-verify only
2512.06009	"Baryogenesis constraints and parameter bounds in f(T, T_G) modified gravity"	Amit Samaddar, S. Surendra Singh	3 December 2025	F-05 (teleparallel-Gauss-Bonnet branch)	Body-access deep-pass + addendum

Labelling clarification (Stephen direction needed for provenance-correction counter): Amendment 9 §3.I and Research Plan v0.5 §7 used the shorthand "Nojiri-Odintsov f(R) baryogenesis" for arXiv:2506.18949. Step 1 provenance verification establishes this refers to the **Nojiri-Odintsov f(R) gravity model class**, NOT to authorship by Nojiri or Odintsov. Actual first author is Kalyan Malakar (with one other). The model-class characterisation remains correct; the shorthand could be misread as authorship. Stephen direction needed on whether to count this as a third provenance correction (raising the count Q4, Q5, +1 = 3) or as a labelling clarification (count stays at 2). Default treatment in §4 trial state: count stays at 2; clarification noted separately.

§3.D Body access on Paper 3 (Samaddar-Singh 2025)

Stephen uploaded the Paper 3 PDF in this thread 27 May AEST. Body access confirmed and integrated:

Paper 3 (Samaddar-Singh 2025 f(T, T_G) baryogenesis): Standard Davoudiasl 2004 gravitational baryogenesis mechanism extended to teleparallel f(T, T*G) gravity with both minimal coupling (∂*μ(T + T*G)) and generalised coupling (∂*μ f(T, T*G)). Two illustrative models examined in a power-law FRW background a(t) = a*0 t^m with m > 1 as inflation surrogate: - Model 1: f(T, T*G) = αT + β√T*G - Model 2: f(T, T*G) = -T + δ T*G log(T_G)

High-energy decoupling parameters adopted: g*b = 1, g*s = 106, T*D = 2×10^{16} GeV, M* = 2×10^{12} GeV (≈ 10^{-7} M*Pl). Observational target η_B/s ≃ 9.42×10^{-11} (per Planck 2016 [55] + Kolb-Turner 1990 [56]). All four numerical cases (two models × two formalisms) reach the observed value.

Substantive honest-disclosure observations from body access (anchor deeppass §7.1–§7.10): - §7.1 arXiv subject classification physics.gen-ph (General Physics catch-all category) - §7.2 observational target 9.42×10^{-11} slightly higher than Pereira/Whittingham cluster values; cross-cluster observational-target heterogeneity continues - §7.3 fitted parameter values span 10^{20} to 10^{110} orders of magnitude across models/formalisms with no naturalness analysis; paper §4 "no extreme fine-tuning" self-characterisation contradicted by displayed parameter values - §7.4 internal text-Table-2 inconsistency on Model 1 generalised m values (page-9 text states 1.2996/1.3117/1.3235; Table 2 displays 1.9053/1.8728/1.8413 identical to Model 1 standard Table 1) - §7.5 M* = 2×10^{12} GeV ≈ 10^{-7} M*Pl extends F-05 cluster M* spread to approximately seven orders of magnitude - §7.6 T*D = 2×10^{16} GeV GUT-scale; conventional in F-05 cluster - §7.7 power-law expansion m > 1 used as inflation surrogate without inflaton field; dynamically less rigorous than Whittingham 2026 Einstein-frame scalaron treatment - §7.8 no GR (Davoudiasl 2004) baseline comparison computed for same parameter set - §7.9 reference-list isolation from contemporaneous 2025 parallel cluster work (Malakar group; Lobo/Lisbon group; Goodarzi); does not cite arXiv:2509.03053 (Sep 2025), arXiv:2509.17218 (Sep 2025), or arXiv:2508.16955 (Aug 2025) despite all predating the 3 Dec 2025 submission - §7.10 cited prior f(T, T_G) baryogenesis result (Azhar-Jawad-Rani 2020 *Phys. Dark Univ.* 30:100724) acknowledged but not quantitatively compared

Peer-review-status verification (anchor deeppass Addendum §2): Web search performed 27 May AEST. arXiv:2512.06009v1 returned as only result for the manuscript identifier across two search queries. No journal publication record after approximately five months on arXiv (3 December 2025 → 27 May 2026). Samaddar-Singh author pair has independent peer-reviewed track record on adjacent modified-gravity topics (*Fortschritte der Physik* 2025/2026; *Int. J. Theor. Phys.* 2025; *Phys. Scr.* 2024; *EPJC* 2023; *Phys. Dark Univ.* 2025; *Nucl. Phys. B* 2025; etc.), but this specific manuscript is not among their accepted peer-reviewed publications in the search-accessible index.

Joint characterisation (anchor deeppass Addendum §3): the six anchor-deeppass §7 quality concerns + absence of independent peer-review correction jointly support the "preprint-only with quality concerns" characterisation. Stephen's "suspect data" assessment is supported by the combined evidence.

§3.E F-05 cluster updates substantive content

F-05 modified-gravity-extensions sub-list in Scaffold v7 §5.2 (to be substantively extended in Scaffold v8 §5.2 at next-thread cycle delivery) receives:

- **Teleparallel-Gauss-Bonnet branch addition** for Samaddar-Singh 2025 alongside the existing Cruz-Pereira-Lobo 2025/2026 f(T, L_m) entry (the only other teleparallel-branch entry in the F-05 sub-list as of Amendment 9 close)
- **Curvature-based branch expansion** for the Malakar group: Paper 1 (arXiv:2506.18949 Nojiri-Odintsov f(R)) and Paper 2 (arXiv:2605.14377 f(R, G*μν T^μν), EMSG-adjacent) added as abstract-verified entries alongside the original-list Paper 4 (Malakar-Mazumdar-Gohain-Bhuyan 2026 f(R, L*m, T)); confirms a coordinated Malakar-group research programme on modified-gravity baryogenesis spanning June 2025 – May 2026
- **Cross-cluster M* spread observation** strengthened: M* ranges across approximately seven orders of magnitude in the cluster as currently constituted — M*Pl (Pereira 2026 STB with ε ≈ 10^{-6} tuning); ≈ 0.4 M*Pl (Whittingham 2026 standard f(R) GB resolution); ≈ 10^{-7} M*Pl (Samaddar-Singh 2025 f(T, T*G)). None of the cluster offers a naturally-determined-from-fundamentals motivation for the specific M* scale chosen.
- **Cross-cluster parameter-tuning landscape** strengthened by Samaddar-Singh observation of 10^{20} to 10^{110} parameter ranges across the two formalisms within their single paper. The F-05 cluster as currently constituted does not converge on naturally-determined parameter values; tuning is endemic at varying severity across the cluster.

§3.F (No F-02 update this cycle)

All three adjacency papers are F-05 territory. No F-02 first-order-phase-transition contributions surfaced. F-02 sub-list unchanged.

§3.G Cross-cluster preprint-status heterogeneity honest-disclosure (new)

The F-05 cluster as currently constituted contains a mix of peer-reviewed and preprint-only contributions:

Peer-reviewed (8 entries): Davoudiasl-Kitano-Kribs-Murayama-Steinhardt 2004 *PRL*; Lambiase-Scarpetta 2006 *PRD*; Ramos-Páramos 2017 *PRD*; Oikonomou-Saridakis 2016 f(T) GB *PRD*; Odintsov-Oikonomou 2016 LQC GB *EPL*; Goodarzi 2026 *JHEP*; Pereira 2026 *PLB*; Cruz-Pereira-Lobo 2025/2026 *NPB*; Malakar-Mazumdar-Gohain-Bhuyan 2026 *Phys. Dark Univ.*

Preprint-only with strong internal quality (1 entry): Whittingham 2026 arXiv:2602.19075v2 — single author JCU Australia; 36 pages; astro-ph.CO; explicit selfconsistency checks per anchor deeppass §5; "presumably submitted to JCAP" per Amendment 9 cycle deeppass §1.

Preprint-only with quality concerns (1 entry): Samaddar-Singh 2025 arXiv:2512.06009v1 — two authors NIT Manipur India; 14 pages; physics.gen-ph; six quality concerns visible from manuscript itself; ~5 months without journal publication record.

Preprint-only abstract-verified only this cycle (2 entries): Malakar 2025 (Paper 1) arXiv:2506.18949 — abstract-verified; journal-publication status not extended this cycle per Stephen direction (item 4 declined); Malakar-Mazumdar-Bhuyan 2026 (Paper 2) arXiv:2605.14377 — abstract-verified; journal-publication status not extended this cycle per Stephen direction.

The F-05 cluster therefore has predominantly peer-reviewed source content, with two preprint-only contributions of distinct quality profiles (Whittingham strong vs Samaddar-Singh with concerns). This is an honest-disclosure observation about cluster source quality, recorded neutrally for downstream synthesis-paper deployment weighting. Modal-status preservation: this characterisation does not validate or invalidate UMF; it informs corpus-discipline awareness of source heterogeneity.

§3.H New references identified for corpus integration (Scaffold v8 §13.2 §5)

The following new entries are flagged for Scaffold v8 §13.2 §5 reference list extension at next-thread cycle delivery:

Three adjacency papers (this cycle): - Malakar, K. + 1 other (2025). arXiv:2506.18949 [gr-qc]. "Gravitational Baryogenesis Constraints on Nojiri-Odintsov f(R) Gravity" - Malakar, K., Mazumdar, R., Bhuyan, K. (2026). arXiv:2605.14377 [gr-qc]. "Cosmological Realization of Baryon Asymmetry in f(R, G*μν T^μν) Gravity" - Samaddar, A., Singh, S. S. (2025). arXiv:2512.06009v1 [physics.gen-ph]. "Baryogenesis constraints and parameter bounds in f(T, T*G) modified gravity". **Preprint-only; no journal publication recorded as of 27 May 2026; preprint-with-quality-concerns characterisation per anchor deeppass §7.1–§7.10 and addendum §2–§4.**

Antecedent via Samaddar-Singh bibliography (foundational): - Kofinas, G., Saridakis, E. N. (2014). *Phys. Rev. D* 90:084044. "Cosmological applications of F(T, T*G) gravity" — foundational f(T, T*G) gravity construction; natural foundational reference for the teleparallel-Gauss-Bonnet branch of F-05 sub-list

Optional via Samaddar-Singh bibliography (Stephen direction needed for any fold-in beyond the three adjacency papers + Kofinas-Saridakis 2014): - Hohmann, M., Jarv, L., Ualikhanova, U. (2017). *Phys. Rev. D* 96:043508 - Duchaniya, L. K., Kadam, S. A., Said, J.

L., Mishra, B. (2023). *EPJC* 83:27 - Capozziello, S., De Laurentis, M., Dialektopoulos, K. F. (2016). *EPJC* 76:629 — motivation for √T*G term - Kofinas, G., Leon, G., Saridakis, E. N. (2014). Class. Quant. Grav. 31:175011 — motivation for T*G log(T*G) term - Azhar, N., Jawad, A., Rani, S. (2020). Phys. Dark Univ. 30:100724 — prior f(T, T*G) baryogenesis result acknowledged but not quantitatively compared by Samaddar-Singh - Azhar, N., Jawad, A., Rani, S. (2021). *Phys. Dark Univ.* 32:100815 — extends 2020 result

§3.I Three Amendment 9 §3.I adjacency papers status — RESOLVED this cycle

The three adjacency papers held aside per Amendment 9 §3.I are now processed via this cycle. The Amendment 9 §3.I "held aside" status is closed.

New adjacency surfaces from this cycle (flagged for potential future-cycle review absent Stephen direction):

- Azhar-Jawad-Rani 2020 *Phys. Dark Univ.* 30:100724 — prior f(T, T_G) baryogenesis result; not currently in corpus; quantitative comparison vs Samaddar-Singh 2025 would inform F-05 teleparallel-branch picture; held aside pending Stephen direction
- Azhar-Jawad-Rani 2021 *Phys. Dark Univ.* 32:100815 — extends 2020 result; similar held-aside status

No additional adjacency papers identified from the Step 1 + Step 2 abstract verifications (Papers 1, 2) beyond what is captured in §3.H above.

§3.J Scaffold v8 + Research Plan v0.6 cycle delivery (pending next-thread)

Per Stephen sequencing direction 27 May AEST (option (ii)): Amendment 10 produced in this thread; Scaffold v8 consolidated + Research Plan v0.6 Draft (DOCX) + Handoff v6 produced in next thread. The Amendment 10 audit-trail anchor provides the clean reference point for the next-thread cycle delivery.

The cycle delivery preserves audit-trail integrity (v7 Scaffold, v0.5 Research Plan, Handoff v5 + Addenda all retain original content unchanged) and propagates the AdjacencyReview2026 substantive findings into consumer documents at next-thread production.

§3.K Items 1 and 5 substantive position implications (modal-status preserved)

Item 5 (UMF G-shock baryon-asymmetry positioning vs F-02 + F-05 class): SUBSTANTIVELY EXTENDED this cycle. Joint structural picture for UMF positioning purposes, incorporating Pereira 2026 (Amendment 9) + Whittingham 2026 (Amendment 9) + Liu-Qin-Bian 2026 (Amendment 9 F-02 alternative class) + Samaddar-Singh 2025 (this cycle):

- (a) Standard f(R) GB with M* = M_Pl undershoots observed η by factor 5–8 (Whittingham 2026)
- (b) STB scalar-tensor completion of F(R) = R^(1+ε) reaches observed η for ε ≈ O(10^{-6}) with M* = M*Pl at T*D ≈ 8.5×10^{13} GeV (Pereira 2026)
- (c) f(T, T*G) teleparallel-Gauss-Bonnet reaches observed η with M* ≈ 10^{-7} M*Pl at T_D = 2×10^{16} GeV and parameter coefficients spanning 10^{20} to 10^{110} across formalisms (Samaddar-Singh 2025, with preprint-with-quality-concerns caveat)
- (d) F-02 alternative class: CPV-operator-alone insufficient by 7 OoM (Liu-Qin-Bian 2026); CME amplification essential

The cross-cluster picture confirms and strengthens the v7 §11.3 Item 5 substantive observation: **the F-05 cluster as currently constituted does not converge on a uniform M* choice, observational-target value, parameter-naturalness regime, or peer-review-status profile across its implementations.** Each branch and each implementation chooses its own parameter regime to fit observation; tuning is endemic at varying severity; source-material peer-review status varies. The cluster does not have a single uncontested mechanism that produces η_obs with naturally-determined parameter values.

Open question for UMF v0.7 / v2.3 technical development (unchanged from Amendment 9 §3.K and strengthened): does UMF G-shock baryon-asymmetry generation naturally produce η_obs with parameter values determined by UMF first principles, or does UMF G-shock occupy a similar tuning landscape to the F-05 cluster? UMF positioning under Item 5 will need to engage all four sub-classes plus the F-02 alternative.

Modal status preserved: open question for UMF source-content technical development. Cluster content does NOT validate UMF; the broadened cluster picture provides a richer comparison set against which any future UMF technical work would be evaluated.

Item 1 / Postulate 2 (reverse baryogenesis at endpoint of bounded spacetime): No direct relevance from this cycle. Samaddar-Singh focuses on forward baryogenesis only; Papers 1, 2 abstract-verifications show no indication of reverse-baryogenesis engagement. The Amendment 9 §3.K "possible candidate territory" flag for STB-class derivative-coupling mechanisms (per Pereira 2026) is unchanged; no new relevance surfaces.

Items 2, 3, 6, 7: No direct relevance.

---

§4 Trial state at Amendment 10 close

- **Trial ID:** S3M0S1 (unchanged)
- **Framework name:** Unified Metric Framework (UMF) (unchanged per Amendment 7)
- **Author of trial:** Stephen L Browne (unchanged)
- **Drafter:** Claude Opus 4.7 Adaptive (Anthropic) (unchanged)
- **Substantive matrix entries:** 26 (unchanged — corpus discipline maintained per Amendment 9 §3.C + Amendment 9 Addendum §7.5; NO new entries this cycle)
- **Theme C deep-pass entries:** 22 (unchanged)
- **Joint-citation patterns:** 13 (unchanged)
- **Headline findings:** 39 (unchanged)
- **Substantive synthesis-paper sections:** 16 (§5.2 + §11.3 Item 5 + §13.2 §5 substantively extended in Scaffold v8 at next-thread cycle delivery; v7 unchanged per audit-trail integrity rule)
- **Follow-up items:** 7 (Items 1, 5, 6, 7 flagged for substantive UMF v0.7 / v2.3 technical development; Items 1 + 2 + 5 with Stephen substantive positions / cluster content integrated; Item 4 closed by Amendment 8)
- **Verbatim primary-source citations:** 85+ (unchanged); three additional Amendment 9 cycle via Stephen-supplied PDFs; one additional this cycle via Stephen-supplied PDF (Samaddar-Singh)
- **Reference-list citations:** ~25 added at Amendment 9 close (v7 §13.2 §5); additional ~5–10 flagged for v8 §13.2 §5 at next-thread cycle delivery per §3.H above
- **Stephen adjudications applied: 19** (18 at Amendment 9 Addendum close + 1 this cycle — Stephen 27 May AEST AdjacencyReview2026 cycle authorisation including Step 3 per-paper decisions and option (ii) sequencing direction; modal status preserved across all integrations)
- **Provenance corrections applied:** 2 (Q4, Q5); one labelling clarification flagged in §3.C above on Amendment 9 §3.I "Nojiri-Odintsov" shorthand (model class vs authorship); Stephen direction needed on count
- **Honest-disclosure corrections: 5** (4 at Amendment 9 close + 1 this cycle — Samaddar-Singh quality concerns including parameter-tuning extremes 10^{20} to 10^{110} + internal text-table inconsistency + peer-review-status preprint-only finding; cross-cluster preprint-status heterogeneity F-05 cluster observation)
- **Methodology framing-bias corrections: 4** (unchanged; #4 modal-status preservation re-applied across AdjacencyReview2026 cycle integrations — Papers 1+2 abstract-verification, Paper 3 body-access, Paper 3 peer-review-status finding, cross-cluster preprint-status heterogeneity observation; standing-rule application, not new correction)
- **Identity and scope corrections:** 2 (unchanged)
- **Postulate registry:** unchanged from Amendment 8 §4.2
- **10-topic review status:** CLOSED (unchanged)
- **Empirical-engagement integration phase:** CLOSED (unchanged)
- **Post-January-2026 reading layer:** CLOSED at Amendment 9 close (unchanged)
- **Deeppass-report gap:** CLOSED at Amendment 9 Addendum (unchanged)
- **Framing-correction integration (scope-expansion vs corpus-currency-due-

diligence): CLOSED at Amendment 9 Addendum (unchanged)
- **AdjacencyReview2026 cycle: CLOSED** at Amendment 10 close — three adjacency papers processed (Papers 1 + 2 abstract-verified; Paper 3 body-access deep-pass + addendum with peer-review-status verification); cycle deliverables Scaffold v8 + Research Plan v0.6 + Handoff v6 pending next-thread per option (ii) sequencing

---

§5 Standing rules

Amendment 9 §5 standing rules reaffirmed unchanged. Amendment 9 Addendum §7.4 (per-paper deeppass-report convention) and §7.5 (periodic corpus-currency verification) standing rules applied and reaffirmed this cycle:

- **§7.4 applied:** Paper 3 body-access deep-pass produced standalone deeppass report (F-05*Paper3*Samaddar2025*AdjacencyReview2026*deeppass.md) BEFORE any consumer-document integration. Methodology corrective convention from Amendment 9 cycle preserved.

- **§7.5 applied:** AdjacencyReview2026 cycle conducted as routine corpus-currency due diligence on Stephen-flagged papers. No fresh scope-expansion authorisation requested or required. Web-search access for verification purposes implicitly authorised.

- **Deeppass-report addendum convention applied:** Per Handoff v5 Addendum 1 §5 critical don't ("If supplementary or corrective deeppass content is needed, produce a deeppass addendum"), the peer-review-status verification finding was captured in F-05*Paper3*Samaddar2025*AdjacencyReview2026*deeppass_Addendum.md rather than via in-place edit of the anchor deeppass. Audit-trail integrity preserved.

No new standing rules introduced in Amendment 10.

---

§6 Self-checks performed

Provenance gate. Paper 3 body access via Stephen-supplied PDF (uploaded in this thread). Papers 1, 2 abstract-verified via web search per §7.5 standing rule. Paper 3 peer-review-status verification via web search per §7.5 standing rule. No provenance gate failures.

Audit-trail integrity. Prior deliverables (Amendments 9 + 9 Addendum; Handoff v5 + Addenda 1 + 2; Scaffold v7 consolidated; Research Plan v0.5 Draft; Introduction Letter v2; three Amendment 9 cycle deeppass reports) retain original content unchanged. New deliverables (Amendment 10 this document; F-

05*Paper3*Samaddar2025*AdjacencyReview2026*deeppass.md; F-05*Paper3*Samaddar2025*AdjacencyReview2026*deeppass_Addendum.md) are versioned new artefacts, not in-place edits.

Framing-bias bidirectionality. Self-check performed. The AdjacencyReview2026 cycle surfaced findings that could be framed either as "validating UMF" (pro-UMF framing bias) or as "showing F-05 cluster has fundamental problems and therefore UMF needed" (anti-cluster pro-UMF framing bias). Both framings rejected; operative modal characterisation is: the AdjacencyReview2026 cycle further enriches the F-05 modified-gravity-extensions sub-list with the teleparallel-Gauss-Bonnet branch (Samaddar-Singh) and the Malakar group expansion (Papers 1 + 2); UMF positioning under Item 5 requires engagement with this active domain; cluster activity does not validate or invalidate UMF; cluster parameter-tuning landscape and source-quality heterogeneity inform comparison-set characterisation, not UMF outcome determination. Framing-bias correction #4 re-applied; no new framing-bias correction logged.

Modal-status preservation. Self-check performed for all integrations including the peer-review-status finding. Paper 3 quality concerns reported as observed from the manuscript + verification methodology; not used to validate UMF; not used to invalidate the F-05 cluster as a whole; not used to elevate the other cluster contributions by comparison. Cross-cluster preprint-status heterogeneity observation reported as corpus-discipline awareness of source heterogeneity, not as a UMF-favouring assessment. Re-confirmed across deeppass §10, addendum §6, and this Amendment 10 §3.G + §3.K.

No new ESCALATE matrix entries. Corpus discipline maintained. 26 substantive matrix entries unchanged. Sub-list updates and reference-list extensions only (to be captured in Scaffold v8 + Research Plan v0.6 at next-thread cycle delivery).

No UMF v0.7 / v2.3 source content engagement. AdjacencyReview2026 cycle did not engage UMF source content. Items 1, 5, 6, 7 substantive UMF technical development remains pending Stephen authorisation.

Per-paper deeppass-report convention compliance. Paper 3 body-access deep-pass produced standalone deeppass report BEFORE consumer-document integration. Papers 1, 2 abstract-verified only and do not warrant deeppass reports under standing convention (per Handoff v5 Addendum 1 §3 + Amendment 9 Addendum §7.4). No deeppass-report gap this cycle.

Peer-review-status verification protocol. Web search performed; results recorded; methodology preserved in anchor deeppass Addendum §2 for future-thread independent re-verification. Verification finding connected explicitly to anchor deeppass §7 quality concerns via Addendum §3 cross-reference table.

---

§7 Items rolled forward to next cycle

Items rolled forward from Amendment 9 §7 unchanged:

- **Items 1, 5, 6, 7 UMF technical development** — flagged for substantive UMF v0.7 / v2.3 source-content work; out of scope absent Stephen authorisation. The Item 5 substantive update in Scaffold v7 §11.3 (Amendment 9) + Scaffold v8 §11.3 (next-thread, this cycle) provides the engagement framework once UMF source-content work is authorised.

- **v1.0 Final synthesis pre-writing scaffolding milestone** — timing pending Stephen direction

- **Module 5 re-initialisation** — timing pending Stephen direction (Module 5 was the original "baryonic matter creation from gravity shock" scope before S3M5S1 → S3M0S1 renumber per Amendment 7)

- **UMF v0.7 / v2.3 source document update** for accumulated corrections: phase-conjugate-wavefront terminology revision (Amendment 7); framework-name correction (Amendment 7); gravitoelectric DM demotion (Amendment 7); Postulate-2 hierarchy (Amendment 8); Item 5 cluster-engagement framework (Amendment 9); F-05 cluster picture extended via teleparallel-Gauss-Bonnet branch (this cycle, Amendment 10); cross-cluster preprint-status heterogeneity awareness (this cycle, Amendment 10) — flagged for Stephen action in next UMF version increment

New items rolled forward from this cycle:

- **Scaffold v8 consolidated + Research Plan v0.6 Draft + Handoff v6 cycle delivery** — pending next-thread per option (ii) sequencing; Amendment 10 (this document) provides audit-trail anchor for that delivery

- **Azhar-Jawad-Rani 2020 + 2021 prior f(T, T_G) baryogenesis results** — flagged in §3.I above as new adjacency surfaces; not currently in corpus; quantitative-comparison-vs-Samaddar-Singh-2025 review pending Stephen direction in future cycle

- **Labelling clarification count question** — Stephen direction needed on whether the Amendment 9 §3.I "Nojiri-Odintsov" model-class vs authorship clarification counts as a third provenance correction (Q4, Q5, +1) or as a separate-tracker labelling clarification (count stays at 2). Default treatment in §4 trial state: count stays at 2.

- **Papers 1 + 2 (Malakar group) peer-review-status verification extension** — declined this cycle per Stephen direction (option 4); could be undertaken in future cycle if Stephen authorises

§8 End of Amendment 10

This Amendment 10 closes the AdjacencyReview2026 cycle's audit-trail-anchor production phase. Trial S3M0S1 is in clean state at Amendment 10 close pending the Scaffold v8 + Research Plan v0.6 + Handoff v6 next-thread cycle delivery.

Next-thread orientation: read Handoff v6 (when produced) as the mandatory first-read; consult Amendment 10 (this document) for the AdjacencyReview2026 cycle audit-trail anchor; consult anchor deeppass + deeppass-addendum for Paper 3 proof-of-research-provenance; consult Amendment 9 + Amendment 9 Addendum + earlier Amendments as prior anchors. Do NOT re-do the AdjacencyReview2026 review; consult §3.C–§3.K above for triage outcomes and substantive findings.

Audit-trail anchor: VC v0.35 Amendment 10 (this document).
